Project Design Phase-II
Technology Stack (Architecture & Stack)

Date	3rd October 2026
Team ID	SWTID-2026-4846
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Technical Architecture:

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2

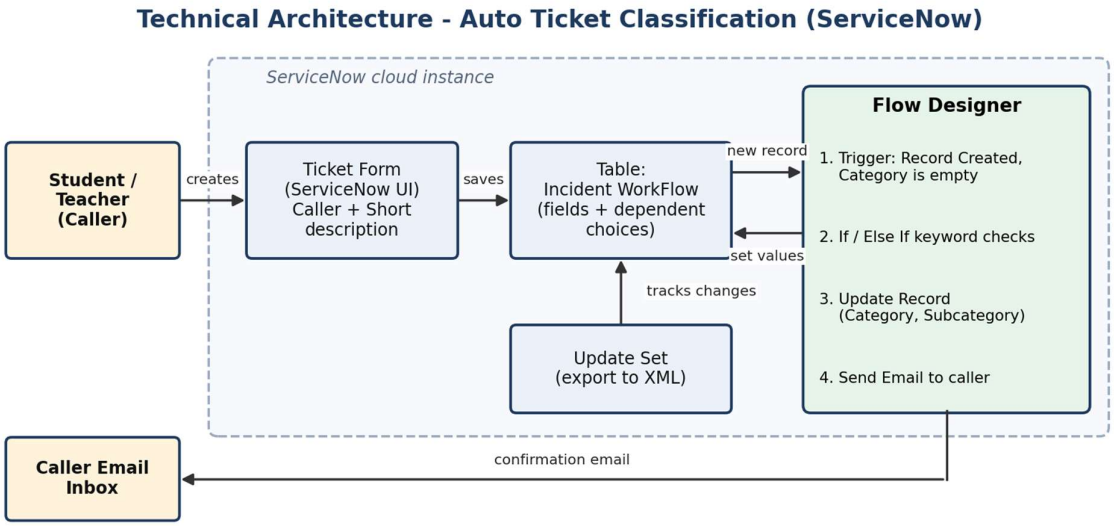

Figure: Technical architecture

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	How users create a ticket	ServiceNow web form (Incident WorkFlow form)
2.	Application Logic-1	Checks the keywords in the Short description with If / Else If	ServiceNow Flow Designer (no code)
3.	Application Logic-2	Sets Category and Subcategory	Flow action: Update Record
4.	Application Logic-3	Sends the confirmation email to the caller	Flow action: Send Email
5.	Database	Stores tickets, fields and the dependent choices	ServiceNow table: Incident WorkFlow
6.	Cloud Database	Database service on the cloud	ServiceNow cloud instance (built-in database)
7.	File Storage	Saves the project work so it can be shared	Update Set exported as an XML file (local system)
8.	External API-1	Not used	None
9.	External API-2	Not used	None
10.	Machine Learning Model	Not used. Tickets are sorted by keyword rules	None
11.	Infrastructure (Server / Cloud)	Where the solution runs	ServiceNow cloud instance (Global scope)

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	No open-source framework is used. Everything is built with ServiceNow no-code tools	ServiceNow Flow Designer
2.	Security Implementations	Users must log in. Access to ticket data is controlled by ServiceNow roles and access controls	ServiceNow roles and access controls (ACL)
3.	Scalable Architecture	New keywords and categories can be added in the flow. It runs on the cloud	Flow Designer, ServiceNow cloud instance
4.	Availability	The solution runs on the ServiceNow cloud, so it is available whenever the instance is available	ServiceNow cloud instance
5.	Performance	The flow runs when a ticket is created and only does simple keyword checks, so there is no heavy work	Flow Designer (Record Created trigger)
